1 Introduction

Tatham Engineering Limited was retained by Triple T Holdings Ltd. to prepare an addendum the *Lakefield South Subdivision - 3358 Lakefield Road - Traffic Study Report*¹ (TIS) completed by Tranplan Associates. This addendum has reviewed the proposed changes to the residential unit counts and commercial gross floor area, reassessed the network operations at the 2029 horizon (to assume partial build-out rather than full build-out as was assumed in the initial TIS) and further assessed network operations for the 2045 horizon. The addendum also addresses comments provided by the Township's peer reviewer with respect to the initial TIS. A response letter providing a brief summary of how the peer reviewer's comments have been addressed is included in Appendix A.

¹ *Lakefield South Subdivision - 3358 Lakefield Road - Traffic Study Report*. Tranplan Associates, March 2020.

2 Proposed Development

2.1 LAND USES

As per the current site plan (refer to Figure 1), the proposed development will consist of the following:

- 262 single-family detached units;
- 109 townhouse units;
- 523 apartment units; and
- 4,000 m² (43,100 ft²) of ground floor commercial space.

It is noted that the site plan indicates a total of 566 apartment units; however, the ground floor commercial space will displace a portion of these units. With an average apartment size of 93 m² (1,000 ft²), the proposed ground floor commercial space (4,000 m² or 43,100 ft²) will displace approximately 43 apartment units, reducing the total apartment unit count to 523 units.

It has been assumed that the ground floor commercial space will be located centrally within the subject site, within the apartment block located immediately east of Water Tower Road and bounded by the internal loop road illustrated in the site plan.

2.2 PHASING

Per communications with the client, construction of the development is expected to commence in 2025. In considering an average build rate of approximately 50 units per year (as is typical for the area), 200 units are expected to be built and occupied by the 2029 horizon. This reflects approximately 25% build-out of the residential component of the site by the 2029 horizon. For the purposes of this study, it is assumed that the commercial development will also be 25% built out by the 2029 horizon.

2.3 TRIP GENERATION

In accordance with the methodologies adopted in the initial TIS, the number of vehicle trips to be generated by the proposed development for the weekday AM and weekday PM peak hours has been determined based on the type of use, development size, and trip generation rates per the *ITE Trip Generation Manual, 10th Edition*². It is noted that the commercial space has been assumed to consist of 50% retail space and 50% office space, for which the *shopping centre* (ITE

² *Trip Generation Manual, 10th Edition*. Institute of Transportation Engineers. September 2017.

land-use code 820) and *general office* (ITE land-use code 710) land-uses have been applied, respectively. Furthermore, as resolved with the peer reviewer, the trip generation for the commercial uses has been established using the fitted curve equations as opposed to the average trip rates, resulting in a more conservative trip estimate (i.e. the fitted curve equations results in greater trip estimates as compared to the average trip rates). The trip rates/equations are summarized in Table 1.

Table 1: Trip Rates

LAND USE	VARIABLE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
		In	Out	Total	In	Out	Total
single family detached (ITE 210)	unit	0.18	0.56	0.74	0.62	0.37	0.99
low-rise apartments (ITE 220)	unit	0.11	0.35	0.36	0.35	0.21	0.56
general office (ITE 710)	gross floor area	$T = 0.94X + 26.49^1$ 86% in / 14% out			$LN(T) = 0.95LN(X) + 0.36^1$ 16% in / 84% out		
shopping centre (ITE 820)	gross floor area	$T = 0.50X + 150.78^1$ 62% in / 38% out			$LN(T) = 0.74LN(X) + 2.89^1$ 48% in / 52% out		

¹ ITE fitted curve equation, where T = trips and X = 1,000 ft² GFA.

Rates for the *single family detached* (ITE land-use code 210) land-use have been considered for both the single-family units and townhouse units, in accordance with the methodologies adopted in the TIS. Trip estimates are summarized in Table 2. As indicated, the site is expected to generate a total of 727 trips during the weekday AM peak and 862 trips during the weekday PM peak.

As resolved between Tranplan and the peer reviewer, a 10% reduction has been applied to the commercial trips (i.e. office + retail) to represent internal trips generated by the proposed development. Internal trips are those trips made without accessing the external road network. For example, someone living in one of the townhouse units near the commercial space may visit a store without needing to use the surrounding external road network, thus generating an internal trip. The net trip estimates are summarized in Table 3.

As indicated, the site is expected to generate 706 new trips during the weekday AM peak and 842 trips during the weekday PM peak upon full build-out. For the 2029 horizon (i.e. 25% build-out), the site will be expected to generate 177 new trips during the AM peak hour and 211 new trips during the PM peak hour.

Table 2: Trip Estimates – Gross Trips

LAND USE (ITE CODE USED)	SIZE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
		In	Out	Total	In	Out	Total
single family (210)	262 units	49	146	195	163	96	259
townhouses (210)	109 units	21	61	82	69	39	108
apartments (220)	523 units	55	186	241	185	108	293
residential total	894 units	125	393	518	417	243	660
office space (710)	21,550 ft ²	40	7	47	4	23	27
retail space (820)	21,550 ft ²	100	62	162	84	91	175
commercial total	43,100 ft²	140	69	209	88	114	202
Total Gross Trips		265	462	727	505	357	862

Table 3: Trip Estimates – Net Trips

TRIP TYPE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
	In	Out	Total	In	Out	Total
residential trips	125	393	518	417	243	660
commercial trips (gross)	140	69	209	88	114	202
internal trips (10% of commercial)	14	7	21	9	11	20
Total Net Trips	251	455	706	496	346	842
Phase 1 Total Net Trips (25%)	63	114	177	124	87	211

3 Traffic Volumes

3.1 EXISTING VOLUMES

The 2018 design hour volumes (DHVs), as provided in the initial TIS, are illustrated in Figure 2.

3.2 BACKGROUND VOLUMES

The 2029 background volumes (as provided in the initial TIS) are illustrated in Figure 3 and are based on the 2018 DHVs with an assumed 2% growth per annum on each road.

To determine traffic volumes for the 2045 horizon year, a 1% growth per annum was applied to the 2029 background volumes on each road. While this is lower than the growth rate applied in the TIS for the period 2018 to 2029, it is in line with historical growth rates observed in census data for the County of Peterborough (approximately 1% per annum from 2011 to 2021) and projected annual growth needed to reach the population targets set out in the province's *A Place to Grow - Growth Plan for the Greater Golden Horseshoe*³ report (approximately 0.85% per annum from 2021 to 2051). The resulting 2045 background volumes are illustrated in Figure 4.

3.3 LAKEFIELD SOUTH VOLUMES

In considering the distribution of the site traffic volumes to the area road system, the residential trips were distributed based on the same distribution applied in the initial TIS, whereas the commercial trips were distributed based on a modified distribution resolved between Tranplan and the peer reviewer. The resulting trip distributions applied are summarized in Table 4.

Table 4: Trip Distribution

GATEWAY	TRAVEL DIRECTION	RESIDENTIAL	COMMERCIAL
Bridge Street	East	22%	30%
Clementi Street	North	2%	5%
County Road 18	West	18%	25%
7 th Line	West	8%	5%
County Road 29	South	50%	25%
Internal	-	-	10%

³ *A Place to Grow - Growth Plan for the Greater Golden Horseshoe*. Province of Ontario. August 2020

The site trips assigned to the network, assuming 100% build-out, are illustrated in:

- Figure 5 for the residential trips;
- Figure 6 for the commercial trips; and
- Figure 7 for the total site trips.

The site trips for the 2029 horizon, reflective of 25% build-out, are illustrated in Figure 8.

3.4 TOTAL VOLUMES

The resulting 2029 and 2045 total traffic volumes (i.e. background volumes + site traffic) are illustrated in Figure 9 and Figure 10.

4 Traffic Operations

The operations of the study area intersections were reviewed under 2029 total conditions (to determine the impact of the revised site trip generation), and for the 2045 horizon under both background and total conditions. The operational assessment has considered the intersection configuration and control as determined in the initial TIS, with intersection geometries reviewed and revised as needed based on subsequent field measurements undertaken by Tranplan (intersection geometries are provided in Appendix B). Procedures outlined in the *2000 Highway Capacity Manual*⁴ (using Synchro v.11 software) were used in the assessment. For signalized intersections, the analysis considers:

- the average delay (measured in seconds);
- level of service (LOS); and
- volume to capacity (v/c) for each signalized movements.

At unsignalized intersections, the analysis considers the same metrics, but with a focus on critical movements only, such as those operating under stop control.

With respect to the noted metrics:

- level of service A corresponds to the best operating condition with minimal delays whereas level of service F corresponds to poor operations resulting from high intersection delays (additional details provided in Appendix C); and
- a v/c ratio of less than 1.0 indicates the intersection movement/approach is operating at less than capacity while v/c of 1.0 indicates capacity has been reached.

Operational summaries at each horizon are provided below, with detailed operations worksheets provided in Appendix D.

4.1 2029 OPERATIONS

A summary of the intersection operations under 2029 total conditions (25% build-out) is provided in Table 5. As indicated, each intersection is expected to provide acceptable operations (LOS D or better) through the 2029 horizon under total conditions, assuming a build-out of approximately 25% of the subject site. Therefore, no network improvements are required to support this level of build-out.

⁴ *Highway Capacity Manual*. Transportation Research Board, Washington DC, 2000.

	WB TR	stop	8	A	0.12	7	A	0.04
	SB LR	stop	9	A	0.16	8	A	0.15

As indicated, and similar to the findings of the initial TIS under 2029 background conditions, the network will provide acceptable operations (LOS D or better) through the 2045 horizon under background conditions. Signal timing plans did not require modifications from those established under 2029 background conditions.

4.2.2 Total Conditions

A summary of the intersection operations under 2045 total conditions (i.e. 100% build-out) is provided in Table 7. Signal timing plans at each intersection were optimized as necessary to ensure optimal operations are achieved.

As indicated, most intersections are expected to provide acceptable operations (LOS E or better) through the 2045 horizon. It is noted that the intersections of County Road 29 with Water Tower Road and with 7th Line both experience poor operations (LOS F) with delays on some movements exceeding 150 seconds during peak times. Therefore, the recommendation to signalize these intersections to address poor operations, as per the initial TIS, is valid by the 2045 horizon.

A reassessment of the noted intersections under signalized control is presented in Table 8 and demonstrates that each intersection will provide acceptable operations (LOS E or better) under signalized control.

It is noted that some intersections along the County Road 29 corridor are operating at or near capacity (i.e. $v/c > 0.95$), which indicates that additional capacity may be needed to accommodate increasing volumes by the 2045 horizon. It is noted that such capacity concerns are also identified in the *Peterborough County 2022 Transportation Master Plan Update*⁵. The *Transportation Master Plan Update* recommends the construction of a new two-lane arterial road and bridge over the Otonabee River. The exact alignment of this new link is not yet determined, but would extend between County Road 29 in the west and County Road 33 in the east (i.e. through the Lakefield South Planning Area, possibly via 7th Line), thus providing an alternative high-capacity route around Lakefield and through the study area. The recommendations in the *Transportation Master Plan Update* are expected to address the note capacity concerns.

Notwithstanding the recommended traffic signals at the intersections of County Road 29 with Water Tower Road and 7th Line, no further improvements to the study area network are considered necessary to accommodate the 2045 future total conditions, recognizing that such will be addressed through the *Transportation Master Plan Update* improvements recommended for the wider road network.

⁵ *Peterborough County 2022 Transportation Master Plan Update*. Paradigm Transportation Solutions Inc. & Stantec. October 2022.

5 Summary

This addendum has been prepared to address comments provided by the peer reviewer and consider proposed changes to the Lakefield South Subdivision development plan. The trip generation for the site has been revisited and the road network operations reassessed for the future horizon years of 2029 and 2045. The following are the findings of the review for each horizon year:

- 2029 horizon
 - Assuming 25% build-out of the site, no improvements are required to accommodate the 2029 conditions.
- 2045 Horizon
 - Traffic signals are recommended for the intersections of County Road 29 with Water Tower Road and 7th Line to support full build-out of the site.
 - While road capacity becomes somewhat limited at select intersections following build-out of the subject development, the capacity concerns are expected to be addressed through improvements to the wider road network as identified in the County's *Transportation Master Plan Update*.

Re: Lakefield South Subdivision, Township of Selwyn
TIS Peer Review Comments -Response Summary

Dear Bill:

This letter provides a summary of our responses to the outstanding peer review comments received from the Township in relation to the *Lakefield South Subdivision - 3358 Lakefield Road - Traffic Study Report¹*. and is supplementary to the *Lakefield South Subdivision - Traffic Impact Study Addendum* (provided under separate cover). The addendum provides a fulsome technical response to the outstanding peer review comments and also considers revisions to the site plan, whereas this letter provides a brief summary of how each of the outstanding peer review comments have been addressed.

For ease of reference, the outstanding review comments are paraphrased in italics below (any comments described as "closed" have not been included). The complete peer review comments provided by the Township's peer reviewer and additional follow-up correspondence are provided in Appendix A.

OUTSTANDING PEER REVIEW COMMENTS

Item 3 – Stantec's differences with Report Intersection Geometrics

The peer review process identified several turn lanes at various intersections assessed in the study which were not correctly sized in the Synchro assessment. In response, Tranplan completed field measurements at the identified lanes to determine the existing dimensions of each. It is recommended that the revised geometrics be applied in subsequent analysis revisions.

The revised intersection geometries established by Tranplan through field measurements have been incorporated in the *Lakefield South Subdivision TIS Addendum*.

¹ *Lakefield South Subdivision - 3358 Lakefield Road - Traffic Study Report*. Tranplan Associates. March 2020.

Item 7 – Discrepancies in site-generated traffic volumes*7.2 – Apartment Trip Generation (LU 220)*

Tranplan identified that trip generation for apartments was completed using person trip rates rather than vehicle trip rates. In consideration of the anticipated revisions to the proposed commercial GFA entailing a reduction in apartment units and the envisioned construction timeframes, it is recommended to use the vehicular trip generation rates to update the trip generation calculations.

Vehicle trip rates were used to determine trip generation of all proposed land uses.

Item 8 – Commercial/Retail Trip Generation Forecasts

Stantec agreed with the methodology provided under separate cover, dated September 14, 2021.

The noted methodology is provided in Appendix A and has implemented in the *Lakefield South Subdivision TIS Addendum*.

Items 12 & 14 – Difference in AM & PM Commercial Trip Distribution

To be revised by consultant

Commercial trip distribution, as resolved through subsequent discussion between Tranplan and Stantec (see Appendix A), was implemented in the *Lakefield South Subdivision TIS Addendum*.

Item 18 – Options for Geometric Improvements at the CR 29/Water Tower Rd Intersection**Item 20 – Use of “All-or-Nothing” Assignment Does Not Account for Diverting Traffic**

Initial comments regarding Items 18 and 20 were intended to account for unexpected driver behaviours, such as drivers seeking alternate routes to bypass intersections experiencing high delays. It is acknowledged that “All-or-Nothing” assignment is acceptable for assignment of site-generated traffic. Request that the need for signalization of currently unsignalized intersections be confirmed.

The need for signalization at the intersections of County Road 29 with Water Tower Road and with 7th Line was reviewed in the *Lakefield South Subdivision TIS Addendum* for each horizon with recommendations identified as informed by the resulting traffic operations.

Item 21 – Signal Timing Plans Appended to the Technical Appendix

Request that signal timing plans used in Synchro assessment be included in technical appendix in order to perform spot checks during the review process.

Signal timing plans as coded in the Synchro assessments are provided in the technical appendices of the *Lakefield South Subdivision TIS Addendum*.

SUMMARY

We trust that the above, in conjunction with the detailed technical analysis provided in the *Lakefield South Subdivision TIS Addendum*, adequately addresses the outstanding peer review comments. Should you have any questions regarding the content provided herein, please do not hesitate to contact us.

Yours truly,
Tatham Engineering Limited

APPENDIX A: PEER REVIEW CORRESPONDENCE

September 21, 2021
File: 160900933

Attention: Iain Mudd, B.A., MCIP, RPP
County of Peterborough
470 Water Street
Peterborough ON
N9H 3M3

Dear Iain Mudd,

Reference: DRAFT Response to the Peer Review of the Lakefield South Traffic Study

Stantec was retained by the Peterborough County ('the County') to perform a peer review of a Traffic Impact Study ('TIS') dated March 30, 2020 prepared for Triple T Holdings Ltd. in support of the proposed *Triple T Lakefield South Subdivision*. Stantec reviewed the TIS report and provided the County with a Peer Review document on July 5, 2021. In September 2021 a comment response document prepared by Tranplan Associates was received.

Tranplan Associates' responses to the peer review comments have been reviewed by Stantec and summarized herein in this memorandum. The evaluation of the comments and the responses are based on Stantec's understanding of the "**DRAFT Response to the Peer Review of the Lakefield South Traffic Study**" document and the revised resources in the Technical Appendix.

1 INITIAL COMMENTS

We agree that this traffic study requirements are not completely in line with a regular TIS. We did not consider TIS requirements in our Peer Review and did not include any TIS specific requirements such as a parking requirement review, internal circulation review, etc. Potential use of the term "TIS" in the Peer Review document could be related to the use of "Traffic Impact Study" term in the original report. The review conducted was to check the accuracy and validity of information and assumptions used in the report to ensure the outcomes can be used to assess the impact of the proposed subdivision to the transportation network in the study area.

As the study horizon year in the traffic study is 2029, the discussion of the subdivision being built over 20-25 years may not be in line with the study scope.

2 BACKGROUND DATA

2.1 ITEM 1 – PROVIDE RAW VOLUME COUNT DATA

A comparison of the observed volume data and DHV volumes used as 2018 has been provided under Exhibits 1 and 2 for the AM and PM peak hours. While the comparison shows the acceptability of the annual growth used for the traffic volume projection, the comment requested the raw data received for the study area (TMC -ATR, or other sources) to be added to the report appendix.

2.2 ITEM 2 - METHODOLOGY FOR BALANCING VOLUMES BETWEEN INTERSECTIONS.

Peer review comment for the provision of a balancing methodology / explanation has been thoroughly addressed by the consultant. It is recommended to add a brief explanation of the considered methodology to the TIS report for reference. Item closed.

2.3 ITEM NO 3. – STANTEC’S DIFFERENCES WITH REPORT INTERSECTION GEOMETRICS

3 INTERSECTION CR 29/7TH LINE

Peer review comment for the consideration of the northbound right turn lane / taper at the intersection has been explained by the consultant and is based on field observations. Item closed

4 INTERSECTION CR 29/CR 18

Peer review comment pertaining to the “west approach” heading has been addressed. Item closed

Peer review comment pertaining to the northbound left storage lane component was explained by the consultant and it is noted that the parallel lane length was updated in the revised Synchro sheets in the technical appendix based on a re-measurement of the study area intersection geometrics. It is recommended to utilize the revised geometrics in the future analysis revisions reflecting the updated unit count / commercial space.

Peer review comment pertaining to the eastbound right storage lane component was explained by the consultant and it is noted that the parallel lane length was updated in the revised Synchro sheets in the technical appendix based on a re-measurement of the study area intersection geometrics. It is recommended to utilize the revised geometrics in the future analysis revisions reflecting the updated unit count / commercial space.

Peer review comment pertaining to the southbound right storage lane component was explained by the consultant and it is noted that the parallel lane length was updated in the revised Synchro sheets in the technical appendix based on a re-measurement of the study area intersection geometrics. It is recommended to utilize the revised geometrics in the future analysis revisions reflecting the updated unit count / commercial space.

5 INTERSECTION – CR 29 AND WATER TOWER ROAD

Peer review comments pertaining to the eastbound right storage lane and the eastbound / westbound left storage lanes were explained by the consultant and it is noted that the parallel lane length was updated in the revised Synchro sheets in the technical appendix based on a re-measurement of the study area intersection geometrics. It is recommended to utilize the revised geometrics in the future analysis revisions reflecting the updated unit count / commercial space.

6 INTERSECTION – CR 29 AND CLEMENTI STREET

Peer review comments pertaining to the storage lane lengths at the intersection were explained by the consultant and it is noted that the parallel lane length was updated in the revised Synchro sheets in the technical appendix based on a re-measurement of the study area intersection geometrics. It is recommended to utilize the revised geometrics in the future analysis revisions reflecting the updated unit count / commercial space.

6.1 ITEM NO 4. – DATA SOURCE FOR THE WILLIAM/CLEMENTI INTERSECTION VOLUMES

Peer review comment pertaining to the source of the turning movement counts at the intersection has been addressed by the consultant. While in general using data collected in 2011 (aged over 10 years) will not be acceptable, considering the information provided and impact of the pandemic on a new traffic count, using the aged data is acceptable. Please include the source data in the TIS appendix report.

6.2 ITEM 5 – CLASSIFICATION OF WATER TOWER ROAD

Peer review comment regarding the classification of Water Tower Road has been addressed by the consultant and is recommended to be added to the TIS report for reference. Item closed.

6.3 ITEM 6 – JURISDICTION OF STUDY ROADS

Peer review comment regarding the jurisdiction of study roads has been addressed by the consultant and is recommended to be added to the TIS report for reference. Item closed.

7 TRIP GENERATION ANALYSIS:

7.1 ITEM 7 – DISCREPANCIES IN SITE-GENERATED TRAFFIC VOLUMES

7.1.1 7.1 - Single Family Homes & Townhouses Trip Generation (LU 210)

Peer review comment regarding the slight discrepancy of the trips generated by LUC 210 (Single Family Homes & Townhomes) has been explained by the consultant and was the result of rounding per traffic zone. Item closed.

7.1.2 7.2 – Apartment Trip Generation (LU 220)

Peer review comment relating to the site generated trips for LU220 utilized for Apartments has been explained by the consultant and was the result of the utilization of person trip generation rates as opposed to vehicular rates. As indicated by the consultant, the total number of units has been revised between the March 2020 and February 2021 reports, and the overall difference between vehicular and person trip generation rates yields 41 trips during the AM peak hour as noted in Exhibit 3. In consideration of the anticipated revisions to the proposed commercial GFA entailing a reduction in apartment units and the envisioned construction timeframes, it is recommended to use the vehicular trip generation rate as the standard practice to update the trip generation calculations. This is also important to note that the in/out distribution ratios are different between the vehicular and person trip generation rates as commented in the initial Peer Review document which may impact the analysis results in a positive or negative way. Assumptions related to the potential trip reductions considering the potential residents of the development can be used separately and applied to the calculated trip generation.

7.2 ITEM 8 – COMMERCIAL/RETAIL TRIP GENERATION FORECASTS

We agree with the methodology provided in a separate document provided on September 14, 2021 and discussed in September 15, 2021 meeting.

7.3 ITEMS 9, 10, 11 & 13 – INCONSISTENCIES IN DISTRIBUTION OF SITE AND BACKGROUND TRAFFIC

Peer review comment pertaining to site generated traffic assignment has been thoroughly explained by the consultant and is based on local knowledge of the area. Item closed.

7.4 ITEMS 12 & 14 – DIFFERENCE IN AM & PM COMMERCIAL TRIP DISTRIBUTION

To be revised by the consultant.

8 SITE TRAFFIC ASSIGNMENT:

8.1 ITEM 15 – ASSIGNMENT FIGURE IN THE TECHNICAL APPENDIX

Peer review comment pertaining to the provision of a traffic assignment figure in the technical appendix has been explained by the consultant. It is noted that the approach of providing total traffic volumes and site generated traffic volumes in one figure is acceptable. Item closed.

8.2 ITEM 16 – DISCREPANCIES BETWEEN ZONE VOLUMES AND TOTAL SITE TRAFFIC

It is fully noted that the minor discrepancies were the result of inserting fixed numbers rather than formulas and will not alter the analysis findings. Item closed.

8.3 ITEM 17 – EXHIBIT FOR SITE TRAFFIC AND BACKGROUND TRAFFIC

Similar to Item 15. Item closed

Reference: DRAFT Response to the Peer Review of the Lakefield South Traffic Study

8.4 ITEM 18 – OPTIONS FOR GEOMETRIC IMPROVEMENTS AT THE CR 29/WATER TOWER RD. INTERSECTION & ITEM 20 - USE OF “ALL-OR-NOTHING” ASSIGNMENT DOES NOT ACCOUNT FOR DIVERTING TRAFFIC

Peer review comments pertaining to the intersection of CR 29 and Water Tower Road improvements as well the application of demand rationalization or capacity restrained assignment have been explained by the consultant. Items 18 and 20 are closely interrelated and were merely suggested to attempt to account for expected driver behavior (selection of alternative travel routes to circumnavigate intersections operating above capacity or with high delays), which may be applicable for the intersection of CR 29 and Water Tower Road in conjunction with the intersection of CR29 with Clementi Street due to the relatively short distance between them (400m) and the presence of connecting roadways within the subdivision's internal road network (despite the all-or-nothing traffic assignment).

As the “All-or-Nothing” approach provides a more conservative estimate of the future traffic volumes and based on the information provided by the Consultant, using it for the traffic assignment is acceptable.

The results provided in the traffic study show that these intersections are expected to work with acceptable level of service in 2029 under background traffic conditions and the additional traffic expected from the development will result in the operational issues in both AM and PM peak hours. The study results also confirm that signalization can provide required mitigations as one of the future options. The exact timing for the provision of the required signals will need to be studied and confirmed as part of the development different phases to be implemented as required.

8.5 ITEM 19 – SENSITIVITY ANALYSES TO DETERMINE THE NEED FOR AN EW COLLECTOR

Peer review comment regarding an east-west collector intersection with County Road 29 was explained by the consultant. Initially, the comment was to explore the feasibility of a new EW collector from a connectivity standpoint (given the distance between the north and south boundaries of the subdivision is approximately 1.4 km. The environmental issues associated with the provision of a new collector are noted. Item closed.

9 INTERSECTION CAPACITY ANALYSIS:

9.1 ITEM 21 – SIGNAL TIMING PLANS APPENDED TO THE TECHNICAL APPENDIX

Peer review comment to append the signal timing plans to the technical appendix was explained by the consultant. The intention of the per review is to perform spot checks to review the phases coded in Synchro.

9.2 ITEM 22 – THE APPLICATION OF THE 0.92 PHF IN THE INTERSECTION ANALYSES

Consultant provided an explanation of the peak hour factor(s) utilized in the analysis and the approach is sound. It is recommended to add a brief explanation in the TIS report for reference. Item closed.

9.3 ITEM 23 – SOURCE FOR USE OF 15% HEAVY VEHICLE AND 10% ON THE 7TH LINE

Consultant provided an explanation of the heavy vehicle volumes utilized in the analysis and the approach is sound. Closing this comment is pending the provision of the raw traffic data to the report.

Reference: DRAFT Response to the Peer Review of the Lakefield South Traffic Study

9.4 ITEM 24 – RE-DO CR 29/7TH LINE TO INCLUDE A NB RIGHT TURN LANE

Covered under Item 3.

9.5 ITEM 25 – TAC VS OTM SIGNAL WARRANT ANALYSES

Consultant provided an explanation for the use of TAC Signal Warrant sheets vs. Ontario Traffic Manual Sheets. Considering that the “input summary and output warrant analysis are contained on a single worksheet” resulting in a “simple and straightforward methodology” for this planning study and the fact that both TAC signal warrant and operational analysis results confirm the requirement of signalization of the studies intersections using TAC Signal Warrant methodology is considered acceptable for this subdivision traffic study.

9.6 ITEM 26 – EXPLAIN THE DIFFERENCES IN FIELD GEOMETRICS AND GEOMETRICS USED IN THE SYNCHRO ANALYSES

Covered under Item 3.

9.7 ITEM 27 – CR 29/7TH LINE NB RIGHT TURN LANE WAS NOT CONSIDERED IN THE STUDY ANALYSES

Covered under Item 3.

9.8 ITEM 28 – REPORT SHOULD CLEARLY DESCRIBE IN DETAIL JUSTIFICATION FOR THE USE OF EACH PARAMETER IN THE INTERSECTION ANALYSES

Covered under Items 3, 22, and 23

9.9 ITEM NO. 29 – A SPECIFIC EXHIBIT ILLUSTRATING THE ACTIVE TRANSPORTATION LINKS SHOULD BE INCLUDED IN THE STUDY REPORT.

Consultant explained that an exhibit illustrating the active transportation links is being prepared. Item closed.

Regards,

Stantec Consulting Ltd.

Attachment: Attachment

c. C.C.

Good Morning Arash

Please find attached additional information on the commercial/retail trip distribution assumptions for Lakefield South as per your email below. I had considered reducing the CR 18 West component by 5% and increasing the CR 29 South by 5% but it's probably a better test of the CR 18/29 intersection the way it is. At the end of the day it probably won't make any real difference in study findings.

If you should require any additional information on the trip distribution just let me know. If it's acceptable I will apply it to the revised trip generation.

Regards

Bill

Subject: RE: Lakefield South revised commercial/retail trip generation

Hi Bill,

Thank you for sending this methodology. Please find below my comments on the MethodRevComTGV1Sept14_21.docx (attached) and below revised commercial /retail trip generation as follows. The comments to the email are added in blue font to the same email.

The commercial trip generation forecasts will be based on the following assumptions:

- There will be a 50/50 mix of retail and non-retail uses. This will mean an area of 45,750 ft² of retail use and 45,750 ft² non-retail use. **Agreed**
- ITE LU 820 *Shopping Centre* will be applied to the retail area **Agreed** but trip generation need to be calculated based on applying both average rate and fitted curve. As the shopping centre rates in ITE were calculated based on surveys on shopping centres with considerably higher GFAs just applying average rates will not result in reasonable trip generation. As an example using only average rates to calculate trip generation entering the site for 4,250 sqm of retail resulted in an estimate of only 10 vehicles entering the site in the AM peak that is considerably low.
- ITE LU 710 *General Office Building* will be applied to the non-retail area **Agreed** but calculate trips based on average rate and fitted curve.
- The apartment unit trip reduction and the new commercial trip generation will be allocated to traffic zones 1, 4 and 6 in proportion to the number of apartment units in each of the 3 zones.
Agreed

Best regards,

Arash Mirhoseini

Subject: Lakefield South revised commercial/retail trip generation

Good afternoon Arash

Attached is a spreadsheet outlining my approach for computing the revised commercial/retail trip generation and trip distribution

I have reviewed the most recent trip generation rates from new just issued ITE Trip Generation Manual 11th ed and the current 10th ed

In reviewing the sheets I have computed the commercial/retail trip generation based on the following assumptions:

- A 50/50 split between each of the two land use types as discussed earlier **Agreed**
- Totalled the combined trip generation for commercial/retail and subtracted the displaced apartment units TG **Agreed but please review the comments in the email body and update the trip generation estimates.**
- A further reduction of 10% to account for internal capture since we are only looking at the traffic on the peripheral study intersections. **Agreed.**

A few comments:

- The 11th ed rates are producing higher traffic forecasts than the 10th ed. **As this study commenced before ITE 11th was issued it can still use ITE 10th rates. No need to update TG rates to ITE 11th.**
- The pre-amble to the 11th ed notes that in general trip generation rates seem to be dropping and post-Covid rates could well remain lower as people will tend to work more from home offices resulting in fewer peak hour trips **As this study commenced before ITE 11th was issued it can still use ITE 10th rates. No need to update TG rates to ITE 11th.**
- Residential peak hour trip generation rates are down in the 11th ed based on pre-Covid observations continuing a trend that was noted from the 9th to the 10th ed. **As this study commenced before ITE 11th was issued it can still use ITE 10th rates. No need to update TG rates to ITE 11th.**
- My preference is to use the TG based on the 10th ed given the nature of Lakefield's overall land use and its present trend towards retirees and empty-nesters. **Agreed**
- Full development of the 8,500 sq m of commercial/retail is an outer anticipated limit of this type of development and committing to potential construction of future road infrastructure for this level of development may overstate future road requirements.
- At the end of the day there will be update traffic studies for the phases as they come on-line. At that point the specific form of that phase of the development will be known and specific road improvements defined to support that phase. **Noted**

- Over time there will also be an accumulation of historic trip generation data specific to Lakefield South that will further help refine the on-going trip generation and distribution analyses [Noted](#)

Trip Distribution for the Commercial/Retail

The third sheet of the file contains my proposed trip distribution for the commercial/retail assignment. I agree with the three assumptions listed in the Excel file/TrpDist tab but how TD percentages were calculated? Is this based on existing traffic volumes and population distribution or is this considering future growth as well? Please provide further information on how the rates were calculated. Also I assume it mean the same rates will be applied for inbound and outbound trips, please confirm.

The nature of this development will likely draw from the local community and areas to the north and east of Lakefield. Areas to the south and west will have an attraction to Peterborough and to a lesser extent Bridgenorth. [Noted](#)

I would appreciate your review and comments on this trip generation approach and the trip distribution. I would like to have an agreement in principal on these 2 items before I get into assignment of trips to zones and then to the network followed up by the revise capacity analyses. If you would like to discuss any of this in more detail just let me know

Regards

Bill

Lakefield South Subdivision

DRAFT - Commercial/Retail Trip Distribution Assumptions Nov. 22/21

The proposed Commercial/Retail trip distribution is illustrated in the attached exhibit. Also included in the exhibit is the original 2003 trip distribution developed by the study consultant and confirmed by Township staff. This trip distribution was developed almost 20 years ago before the significant transition of Lakefield into a more “empty nester” community. The 2003 trip distribution has been used as a guide for the current (2021) study analyses. It has been modified to bring it in line with the current study road network and fabric of the currently planned Lakefield South community. It will be noted that it was assumed in 2003 that 40% of the commercial/retail travel would be internally generated by new Lakefield South community. **This study, as a worst case, is assuming only 10% internal commercial/retail trip generation.**

In reviewing the 2 tables attached, it will be noted that there are some similarities in the assumed trip distribution and some differences. Much of these differences are driven by the assumed 40% internal capture used in the 2003 analyses. When the full Lakefield South study area is built out, this may be the case, but in the context of this study it is unlikely that there will be this level of internal capture.

The proposed draft trip distribution is based on the 5 gateways assumed in the current study road network. The trip distribution assumptions by gateway are as follows:

1. CR 29 (Bridge St) East - 30%

This is the main gateway to the commercial core of Lakefield and much of the existing residential and retail development in the Lakefield community. It will be the largest source/destination of much of the external travel to/from the new Lakefield South subdivision.

2. Clementi Street – 5%

It is expected that there will be some travel to/from the residential areas in this part of Lakefield. During the summer there is an active RV campground and recreational facilities along the west side of the Otonabee River.

3. CR 18 West – 25%

This gateway will contain traffic from the west including Bridgenorth and the north end of Peterborough as well as the commercial areas along the Chemong Road corridor. In addition, it will be also carrying traffic from the CR 23 (Buckhorn Rd.) corridor that serves communities to the north and west of Lakefield including the First Nations community of Curve Lake. Lakefield is an important service centre for these communities.

4. 7th Line West - 5%

The 7th Line West presently carries mostly local traffic. It has good connectivity to the CR 23 corridor and Bridgenorth to the west. It could also be part of the new corridor leading to the future Otonabee Bridge Crossing. Since its role is not entirely clear at this time, only a minimum of traffic will be assigned to this gateway.

5. CR 29 (Lakefield Rd) South - 25%

Given Lakefield's proximity to the City of Peterborough there will be a continuing interaction with the overall Peterborough community for work trips, retail shopping, commercial activity and recreational travel.

6. Internal Capture – 10%

It is assumed that some of the commercial/retail travel will be internal capture within the Lakefield South community. In the future, with full development of Lakefield South, the internal capture will likely be larger, however, as a worst case, an internal capture of 10% was assumed for the study analyses.

CAPACITY ANALYSIS AT SIGNALIZED INTERSECTIONS

Highway Capacity Manual Methodology

The capacity of signalized intersections has been determined in terms of delay taken from Chapter 9 of the Highway Capacity Manual, Special Report 209, by the Transportation Research Board, 2000.

To assist in clarifying the arithmetic analysis associated with traffic engineering, it is often useful to refer to "Level of Service". Level of Service (LOS) for signalized intersections is defined in terms of delay, which is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Only the portion of total delay attributed to the control facility is quantified. This control delay includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay. The following table describes in detail the characteristics of each level:

Level of Service	Expected Delay to Minor Street Traffic	Average Control Delay 'd' (sec/veh)
A	Describes operations with very low control delay, up to 10 seconds/vehicle. This level of service occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all at this LOS. Short cycle lengths may also contribute to low delay.	$d \leq 10$
B	Describes operations with control delay greater than 10 seconds and up to 20 seconds/vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop at this level than at LOS A, causing longer average delays.	$10 \leq d \leq 20$
C	Describes operations with control delay greater than 20 seconds and up to 35 seconds/vehicle. These higher delays may result from fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.	$20 \leq d \leq 35$
D	Describes operations with control delay greater than 35 seconds and up to 55 seconds/vehicle. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavourable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures become noticeable.	$35 \leq d \leq 55$
E	Describes operations with control delay greater than 55 seconds and up to 80 seconds/vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.	$55 \leq d \leq 80$
F	LOS F describes operations with control delay in excess of 80 seconds/vehicle. This <i>oversaturation</i> , considered to be unacceptable to most drivers, occurs when arrival flow rates exceed the design capacity of the intersection. It may also occur at high v/c ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such high delay levels.	$d > 80$

CAPACITY ANALYSIS AT UNSIGNALIZED INTERSECTIONS

Highway Capacity Manual Methodology

The level of service at an unsignalized intersection is determined on the basis of control delay for each critical lane. This method of analysis is taken from the Highway Capacity Manual, Special Report 209, by the Transportation Research Board, 1997.

The average control delay for any particular critical movement (control delay includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay) is a function of the service rate or capacity of the approach and degree of saturation. The level of service criteria for unsignalized intersections is outlined below and is related to ranges in vehicle delay.

Level of Service	Expected Delay to Minor Street Traffic	Average Control Delay 'd' (sec/veh)
A	Little or no delays	$0 < d \leq 10$
B	Short traffic delays	$10 \leq d \leq 15$
C	Average traffic delays	$15 \leq d \leq 25$
D	Long traffic delays	$25 \leq d \leq 35$
E	Very long traffic delays	$35 \leq d \leq 50$
F	Extreme delays with queuing which may cause congestion affecting other traffic movements in the intersection	$d > 50$
